SYSTEM**

service type set to the voice packet.

COPYRIGHT: (C)2001 JPO

(57) Abstract

PROBLEM TO BE SOLVED: To provide a priority control method for a network system by which congestion control is executed in the Internet according to the priority set for each extension terminal accommodated in an exchange.

SOLUTION: The priority control method of this invention adopts an exchange 13 accommodating extension terminals 11 and 12, an IP network 16 and a connector 17. When the extension terminal 11 sets up a call via the IP network 16, the exchange 13 informs the connector 17 about a priority class corresponding to the extension terminal 11. The connector 17 acquires a service type corresponding to the informed priority class and stores it as the service type. After setting up, the connector 17 transmits a voice packet to which the stored service type is set to the Internet 16. The Internet 16 executes priority control on the basis of the
